

TA Checklist: Programming Assignment 1 — Weekly Progress Checkpoints

Computer Programming (010153002) | Semester 1/2026

For use alongside *PA1: Build a Game with raylib*. One copy per team, per checkpoint.

Team: _____ **Members:** _____

How to Use This Sheet

Each team submits three checkpoints before the final code submission and presentation (see the assignment sheet). Checkpoints are **low-stakes and not separately scored**, but repeated missed or shallow checkpoints should be reflected in that team's **Teamwork & Individual Contribution** score on the final rubric — note it here so it isn't forgotten by grading time.

Checkpoint 1 — Concept & Setup

target: Thu, 24 Sep 2026

- ☐ All 3 team members identified; roster matches the course portal
- ☐ Game concept is described in 1–2 sentences and fits the course's scope (playable with the topics from Lectures 1–10, not an over-ambitious engine/genre)
- ☐ raylib toolchain confirmed working: a window opens and draws *something* (shape, text, or image) without crashing
- ☐ Status note explains *who* is doing *what* for the coming week

Verdict: ☐ On track ☐ Needs follow-up ☐ Missing

Notes / feedback to send the team:

Checkpoint 2 — Core Loop

target: Thu, 1 Oct 2026

- ☐ Main loop follows `while (!WindowShouldClose())` with update logic and drawing clearly separated (not everything crammed into one block)
- ☐ At least one `struct` is defined *and* used to hold real game state (not just declared and ignored)
- ☐ At least one array is in use for a collection of entities/data (not a handful of loose variables standing in for a list)
- ☐ Game state visibly changes frame to frame (not a static screen redrawn every tick)
- ☐ Spot-check for disallowed scope: no C++ classes/`std::vector`/`new` or unrelated external libraries

Verdict: ☐ On track ☐ Needs follow-up ☐ Missing

Notes / feedback to send the team:

Checkpoint 3 — Feature-Complete Draft

target: Thu, 8 Oct 2026

- ☐ Game is playable start to finish; a win/lose/end condition can actually be reached

- ☐ Coverage matrix draft submitted, mapping **at least 5 of the 9** required topics to specific files/functions
- ☐ Code is split across multiple functions, not one long `main`
- ☐ Status note credibly describes each member's contribution so far (useful evidence if a teamwork dispute comes up later)
- ☐ Any code the team can't yet explain, or that looks copy-pasted/AI-generated, is flagged back to the team *now* — while there's still time to fix it

Verdict: ☐ On track ☐ Needs follow-up ☐ Missing

Notes / feedback to send the team:

Escalate to Instructor If...

- A team misses **two or more** checkpoints without a valid reason
- A team's submitted code repeatedly contains material they cannot explain
- Contribution looks badly unbalanced across members (e.g. one member has done essentially nothing across all three checkpoints)
